

Here is an overview of the different ways to import code from another module:

Import statement	How to use this	Description
import math	print(math.pi)	Import all of math, keep it separate
import math as m	print(m.pi)	Same as above, but give it an alias
from math import pi	print(pi)	Import one thing (value) from math and put it in the global namespace
from math import pi as p	print(p)	Same as above, but give it an alias
from math import *	print(pi)	NOT RECOMMENDED. At best this makes it difficult to see where something comes from. At worst you may overwrite something without knowing it
