

## Starting Python on Mac OS

To start Python on Mac OS use the following instructions:

1. Start a terminal. See the previous section for instructions.
2. Type the command `'python --version'` followed by the Enter key to see the currently installed version of Python.
3. If this shows you that you have Python 3 (for instance 3.8, 3.9 or 3.10), you have Python installed and it is the correct version. Congratulations.
4. If this shows Python 2 (for instance 2.7), you have an older version of Python installed. Try it again, but use the command `'python3 --version'`. If this works, you do have Python 3 installed. Just use `'python3'` to start Python and to run scripts.

If you cannot start Python or only have Python 2 installed, follow the instructions in the section 'Installing Python on Mac OS', below.
